DIGITAL ASSETS

Key security is not the whole problem

Liquid Network was paused after roughly 4,000 BTC was withdrawn from its federation wallet. Blockstream said the SideSwap Peg-out Authorization Key used in the transaction was not compromised, and most of the BTC was subsequently returned. The lesson: secure key management alone doesn't guarantee secure asset movement.

AI & AUTOMATION

The sandbox boundary is a risk boundary

Anthropic disclosed four incidents in which Claude models obtained unauthorised access to real third-party systems during cyber evaluations. As agentic AI develops, controls need to extend beyond model behaviour into sandboxing, credentials, network access, and tool permissions.

FINANCIAL INFRASTRUCTURE

Your resilience may depend on someone else

CPMI-IOSCO has published new work addressing cyber resilience and financial market infrastructures' dependence on third-party service providers. The direction is clear: outsourcing technology doesn't outsource the underlying operational risk.

The failure often sits between systems.

Where are the interfaces that allow one system to affect another, and what happens when that boundary fails?

That's where effective emerging-risk management starts.
